Clinton, Tennessee

RE: U.S Environmental Protection Agency Site Investigation  
Magnet Mills Facility, Cullom Street, Clinton, TN

Dear Mr. Comer:

Please find attached the sample summary table for samples the U. S. Environmental Protection Agency (EPA) collected during the May 1, 2008 site investigation of your property at 101 Cullom Street, Clinton, TN.

The data indicates the presence of flammable liquids, suspected to be methanol and alcohol, and polychlorinated biphenyls (PCBs) in the drums of transformer oil. Low level PCBs were detected in the soils surrounding the transformer pad areas.

EPA encourages you to work with the Tennessee Department of Environment & Conservation (TDEC) to identify and properly handle and dispose of regulated material that poses a threat of release to the environment. Until disposition of the material is complete, you should keep the material under roof in secure containers and periodically inspect the material to check and ensure the integrity of the containers.

As long as your actions are satisfactory to TDEC, EPA does not anticipate further involvement with the property. If you wish to discuss this matter, please contact me at 731-394-8996.

Sincerely,

Steve Spurlin  
On-Scene Coordinator  
EPA Region 4
